El código de color CMYK es un modelo de color sustractivo que utiliza cuatro componentes: Cian (C), Magenta (M), Amarillo (Y) y Negro (K). Los valores para cada componente varían entre 0 y 100, y representan porcentajes de cada color utilizado en la mezcla. Por ejemplo, el color asignado al Jurásico en formato CMYK es 80 / 0 / 5 / 0, lo que indica una combinación del 80% de cian, 0% de magenta, 5% de amarillo y 0% de negro.

Esta versión de la tabla fue desarrollada por el grupo de investigación Geología de Colombia del Servicio Geológico Colombiano.

La composición de colores fue realizada en 2008 por J. M. Pellé del Servicio Geológico Francés (BRGM).
